Field of the Invention The present invention relates to a nonvolatile memory that stores information in a floating gate, a method for controlling the nonvolatile memory, and a method for setting a program voltage and a read voltage. 2. Description of the Related Art Conventionally, a flash memory, which is a type of nonvolatile memory, has been proposed in which a word line that serves as a gate of a memory cell, a select gate transistor that switches between a bit line and the word line, and a source line that supplies a voltage are formed on a semiconductor substrate. The memory cell has a floating gate in which information is stored. The select gate transistor includes a select gate, a gate of a select transistor. The bit line is connected to the memory cell and the source line is connected to a source of the select gate transistor. A read voltage is supplied to a word line and the select gate transistor is turned on, whereby a potential of a bit line changes based on a data value stored in the memory cell. Further, a control gate of the select gate transistor is set at a power supply voltage V_{cc} or ground potential (0V), whereby a data value is read. Next, a 1d6a3396d6
