Field of the Invention This invention relates to plasma generators and, more particularly, to RF energized plasma generators, or corona discharges, for coating at least one side of a moving substrate with a non-homogeneous composition which, when activated by application of RF energy, results in the uniform application of material to the surface of the substrate. This invention also relates to the methods of coating substrates with a non-homogeneous composition. 2. Background Information Plasma coating devices are known to the prior art which use a plasma surrounding the surface of a moving substrate for applying material to the substrate. In a typical prior art configuration, a plasma is generated in the vicinity of the surface of a substrate which is passing through a chamber. As the substrate moves through the chamber, material is applied to the substrate via the plasma. One such

Agree to be permanently removed only once you see the challenge code and only once.Q: Which is more beneficial: Multiple threading or multiple jobs/threading? Let's say I have a 1GB serial number file to process using my computer. My computer has 100% of its processing power for this. I use ascii files to build my command line argument(arguments), split them into args and run the code with them. Which of the following two methods would be more effective and why? Method 1: 100% of the time, my computer would just take it and when it finishes, it would give feedback. - Method 2: 1) I parse the file into a list of arguments. 2) Process the file using my computer 3) Process the rest of the arguements. I understand that method 2 will not be as efficient and will be very slow compared to method 1. But if I'm going to have a very huge collection (like say 10k) of arguments is method 2 better or is method 1 more preferable? A: The answer is B, 100% of the time. Unless the algorithm you are using to parse the serial numbers uses at least in theory an exponential amount of time, your memory (1 GB) is always a bottleneck. Method 2 takes time to perform the split but, since you have a very big problem, the CPU time is very small compared to the memory usage. In order to tell which method is better, you need to know how much time is spent by your algorithm. Afternoons with Nicola Benedetti Located in the town of Sosnova Novospassky Distance: 110 km Activities: walking, cycling, standing, driving Tasting notes: On the road to Sosnova Novospassky The road to Sosnova Novospassky is an old route of church services. It has been restored and it is considered as a touristic route.
